

Returns and Refund Policy

Customer Support Knowledge Base

1. Return Eligibility

Products may be returned within 30 days of delivery, subject to the applicable return conditions. The 30-day period is measured from delivery rather than the date the customer first contacts support.

Customer question: I received my product yesterday. Can I request a return? **Answer:** The product is within the 30-day return window, but eligibility also depends on its condition and the reason for the return.

2. Return Conditions

Customers should keep the product, packaging, supplied accessories, and applicable documentation when requesting a return. Missing components may affect inspection or eligibility.

A return request should accurately describe the condition of the product. Customers should not represent physical damage as a manufacturing defect.

3. Manufacturing Defect

A manufacturing defect is a problem originating from production that causes the product to fail to meet expected specifications. Manufacturing defects are covered by the applicable warranty.

Examples may include a component that fails under normal intended use without evidence of accidental damage or unauthorized repair.

4. Hardware Malfunction

Hardware malfunction is a covered warranty condition subject to verification. Customers should follow troubleshooting instructions before requesting warranty service when the issue may be resolved through normal configuration steps.

5. Physical and Accidental Damage

Physical damage includes damage to the device housing, components, or other parts caused by impact or external force. Accidental drops are excluded from warranty coverage.

A physically damaged product may still be considered under the return process depending on when and how the damage occurred. Damage discovered on delivery should be reported promptly as delivery damage.

6. Damage During Delivery

Customers who receive a visibly damaged package or device should document the condition and contact support promptly. Delivery damage is distinct from a manufacturing defect and may require shipment or inspection information.

Customer question: My device arrived cracked. Is that a warranty defect? **Answer:** Not necessarily. Damage discovered upon delivery should be reported as delivery or physical damage so the appropriate process can be followed.

7. Water Damage

Water damage is excluded from warranty coverage. Customers should keep devices away from water and should not attempt unsafe repairs on a water-damaged device.

8. Return Authorization and Shipping

Customers should follow the return instructions provided by support before sending a product back. Use the instructed shipping process and retain relevant shipment information.

Do not send a product to an address obtained from an unofficial source.

9. Inspection

Returned products may be inspected to determine condition and applicable eligibility. Inspection can distinguish a manufacturing defect, hardware malfunction, physical damage, accidental damage, or other condition.

Customers should provide an accurate description of the problem and any relevant circumstances surrounding the issue.

10. Refunds

Approved refunds are processed according to the applicable return process and payment method. Customers should allow time for inspection and payment processing.

A refund request does not automatically guarantee approval; the returned product must satisfy the applicable eligibility conditions.

11. Exchanges and Replacements

Customers seeking an exchange or replacement should contact support and describe the issue. Availability and eligibility depend on the applicable return, warranty, and inspection process.

12. Non-Returnable or Ineligible Conditions

A product outside the 30-day return period may not qualify for a standard return. Unauthorized repairs, physical damage, water damage, and accidental drops are not covered by warranty.

Customers should request a review when unusual circumstances apply rather than assuming an exception.

13. Examples

Eligible example: A customer receives an eligible product and requests a return within 30 days under the applicable return conditions.

Warranty example: An electronics product develops a manufacturing defect during its 12-month warranty period and passes the applicable verification.

Ineligible warranty example: An electronics product is damaged by an accidental drop. Accidental drops are excluded from warranty coverage.

14. Escalation

If a customer disagrees with a return or refund outcome, request escalation and provide the relevant order information, issue description, and previous steps. Escalation does not automatically override the policy.

Return Decision Scenarios

Scenario: Product delivered yesterday with a manufacturing defect. The product is within the 30-day return period and may also qualify for warranty review; support should determine the appropriate route.

Scenario: Product delivered yesterday with accidental-drop damage caused by the customer. The product is within the return window, but the damage may affect return eligibility and is excluded from warranty.

Scenario: Product delivered 45 days ago with a hardware malfunction. The standard 30-day return period has passed, but hardware malfunction may be reviewed under the applicable warranty if within its warranty period.

Scenario: Product arrived damaged in the box. Report delivery damage promptly rather than describing it as a manufacturing defect.

Returns FAQ

Does the 30-day period start at delivery? Yes.

Is every issue within 30 days automatically refundable? No. Eligibility and condition must be reviewed.

Are accidental drops covered by warranty? No.

Are manufacturing defects covered by warranty? Yes, subject to verification.

Can I request an exchange? Contact support to determine applicable options.

Should I hide physical damage when returning an item? No. Accurate condition information is required.

Detailed Customer Scenarios and Decision Examples

The following examples illustrate how the knowledge base should be applied to different customer wording. The examples intentionally use varied language so retrieval systems can connect related requests to the correct policy.

Within-window example

A product delivered ten days ago is within the 30-day return period. The customer should still meet the applicable condition and eligibility requirements.

Recommended support approach: identify the customer's intent, locate the applicable documented rule, state only what the knowledge base supports, and provide the next appropriate action. If eligibility cannot be established from the available information, request the relevant details or direct the customer to support review rather than inventing an exception.

Late-return example

A product delivered 45 days ago is outside the standard 30-day return window. A warranty review may still be appropriate if the issue is a covered warranty condition.

Recommended support approach: identify the customer's intent, locate the applicable documented rule, state only what the knowledge base supports, and provide the next appropriate action. If eligibility cannot be established from the available information, request the relevant details or direct the customer to support review rather than inventing an exception.

Defect example

An electronics device develops a manufacturing defect during its warranty period. The customer can request warranty review subject to verification.

Recommended support approach: identify the customer's intent, locate the applicable documented rule, state only what the knowledge base supports, and provide the next appropriate action. If eligibility cannot be established from the available information, request the relevant details or direct the customer to support review rather than inventing an exception.

Accidental-damage example

A customer drops a device and the housing cracks. The damage is physical and accidental, so it is excluded from warranty coverage.

Recommended support approach: identify the customer's intent, locate the applicable documented rule, state only what the knowledge base supports, and provide the next appropriate action. If eligibility cannot be established from the available information, request the relevant details or direct the customer to support review rather than inventing an exception.

Delivery-damage example

A device arrives visibly damaged. The customer should report the condition promptly as delivery or physical damage rather than describing it as a manufacturing defect.

Recommended support approach: identify the customer's intent, locate the applicable documented rule, state only what the knowledge base supports, and provide the next appropriate action. If eligibility cannot be established from the available information, request the relevant details or direct the customer to support review rather than inventing an exception.

Refund example

An approved return proceeds through inspection and refund processing according to the applicable return process and payment method.

Recommended support approach: identify the customer's intent, locate the applicable documented rule, state only what the knowledge base supports, and provide the next appropriate action. If eligibility cannot be established from the available information, request the relevant details or direct the customer to support review rather than inventing an exception.

Knowledge Retrieval Reference

Customer questions may use different terms from the policy. For example, a customer may say that an item is broken, faulty, damaged, defective, or not working. The support process should distinguish the underlying condition rather than relying on a single keyword.

A return question should be evaluated against the return period, product condition, reason for return, and applicable exclusions. A warranty question should be evaluated against warranty duration, covered conditions, and exclusions.

A shipping question should be evaluated against order processing, carrier tracking, delivery status, address information, and shipment condition. A troubleshooting question should be evaluated against the specific symptom and the documented diagnostic procedure.

When the knowledge base does not contain sufficient information to answer a question, the system should not manufacture an answer. It should clearly state that the available customer-support knowledge base does not contain sufficient information.

Source citations should identify the document, page, relevance, and retrieved text needed to explain the answer. Internal prompts, credentials, environment variables, and unrelated system information should never be exposed through citations.

Support Interpretation Example 1

Example 1: A customer uses informal language to describe a returns and refund policy issue. The correct response should map the customer's description to the closest documented policy or procedure, avoid unsupported assumptions, and identify the relevant next step. If the available documentation is insufficient, the response should stop at the knowledge-base limitation instead of supplying unrelated general knowledge.

Support Interpretation Example 2

Example 2: A customer uses informal language to describe a returns and refund policy issue. The correct response should map the customer's description to the closest documented policy or procedure, avoid unsupported assumptions, and identify the relevant next step. If the available documentation is insufficient, the response should stop at the knowledge-base limitation instead of supplying unrelated general knowledge.

Support Interpretation Example 3

Example 3: A customer uses informal language to describe a returns and refund policy issue. The correct response should map the customer's description to the closest documented policy or procedure, avoid unsupported assumptions, and identify the relevant next step. If the available documentation is insufficient, the response should stop at the knowledge-base limitation instead of supplying unrelated general knowledge.

Support Interpretation Example 4

Example 4: A customer uses informal language to describe a returns and refund policy issue. The correct response should map the customer's description to the closest documented policy or procedure, avoid unsupported assumptions, and identify the relevant next step. If the available documentation is insufficient, the response should stop at the knowledge-base limitation instead of supplying unrelated general knowledge.

Support Interpretation Example 5

Example 5: A customer uses informal language to describe a returns and refund policy issue. The correct response should map the customer's description to the closest documented policy or procedure, avoid unsupported assumptions, and identify the relevant next step. If the available documentation is insufficient, the response should stop at the knowledge-base limitation instead of supplying unrelated general knowledge.

Support Interpretation Example 6

Example 6: A customer uses informal language to describe a returns and refund policy issue. The correct response should map the customer's description to the closest documented policy or procedure, avoid unsupported assumptions, and identify the relevant next step. If the available documentation is insufficient, the response should stop at the knowledge-base limitation instead of supplying unrelated general knowledge.
